

Ten

ADVANTAGES

OF HYDRONIC HEATING

1

Fewer Allergies

Hydronic systems don't use blowing air that can spread dust, germs, viruses, allergens and pet dander that trigger symptoms.

2

Zone Heating

Tubing can be run in areas with limited airflow and zone valves can be used to heat specific areas

3

New Construction

Hydronic systems can be installed without adding ductwork, vents or registers them a great choice for new construction.

4

Warm Floors

Radiant floor hydronic systems provide an extra level of comfort by heating the floor and other surfaces..

5

No Filters

These systems don't require air filters because they don't produce blowing air. This feature can save time and money spent replacing furnace filters.

Low Noise

These systems are very quiet. Apart from a water heater or boiler firing, hydronic heating works without a lot of noise..

6

Efficient

It takes less energy to circulate water than it does to blow hot air, so hydronic systems are more energy efficient than air systems.

7

No Heat Loss

Heat produced by a hydronic system doesn't get lost while traveling through ductwork..

8

Flexible Design

Tubing can be run in areas with limited airflow and zone valves can be used to heat specific areas.

9

Low Energy Use

Hydronic heat feels warmer at lower thermostat settings partially because the air doesn't blow the way it does with in forced air systems.
